Apply constraint as required:

Create table employee with following attribute : (emp_id, emp_name,dept_id, dept_name, dob,salary, Organization_Name). Such that none of the employee_id and dept_id should repeat. Also create composite key of emp_id and dob.

Each of the employee should belong to any department, so that it is mandatory to enter the values of dept_name.

Apply the constraint, such that salary should always be greater than 20000 and Organization name can automatically fetched, in case entry has not been done for that particular column.
